Suggestions

1. **Avoid darker shades in color**
   The color scale used for the graphs assigns darker shades to some elements. This makes some captions difficult to see. The scale should be adjusted so that darker colors doesn't get assigned.

2. **Placement of views**
   The alignment of the views can be improved. Also the size of the of the views is not consistent and should be redesigned.

3. **Captions (state names) on map**
   The states on the map should be labeled by the state abbreviation. It will help a user who is not familiar with all the states to select.

4. **Maximum state selection alert**
   The pie chart and the bar chart will become crowded when the number of selected states are more. There should be a limit on number of selections and user should be notified when the number of selections exceeds the maximum.

5. **Change the titles**
   The titles of the views should be renamed to make them more intuitive. The current titles are not specific and don't tell much about the view. Also the current year selection should be displayed in the views so that the user can relate to slider value.
